TEST REPORT

Intertek Report No.: 190603004SZN-001

EXHIBIT 1

GENERAL DESCRIPTION

1.0 General Description

1.1 Product Description

The equipment under test (EUT) is a UHF transmitter operating in 917~922.2MHz band. It contains two modules that have already been certified. One certified module is operating at 2.4GHz band and subjected to FCC ID: XRSCRMXTIMO101, another certified Bluetooth module is subjected to FCC ID: A8TBM77SPPSYC2A. The EUT is powered by a 3.6VDC rechargeable battery which can be charged via a micro USB cable by an AC/DC adapter with the input of AC100-240V, 50/60Hz, and output of DC 5.0V, 1.5A. The EUT also has a 3.5" socket which can be used to connect to DMX controllers via an adapter cable that is 3.5" jack to 5-pin XLR male. When DMX port connected, the UHF transmitter will stop transmitting. When DMX port is disconnected, the UHF transmitter and Bluetooth can be transmitted Simultaneously.

Type of Modulation: GFSK

Antenna Type: Integral Antenna

Antenna Gain: 3.0 dBi

For electronic filing, the brief circuit description is saved with filename: descri.pdf.

1.2 Related Submittal(s) Grants

This is an application for certification of a transceiver for ART7 operating at 917-922.2MHz.

Remaining portions are subject to the following procedures:

The Bluetooth modular had been certified and subjected to FCC ID: A8TBM77SPPSYC2A.

The 2.4GHz modular had been certified and subjected to the FCC ID: XRSCRMXTIMO101

Other Digital Function: Subject to FCC Part 15B SDOC.

1.3 Test Methodology

Both AC mains line-conducted and radiated emission measurements was performed according to the procedures in ANSI C63.10: 2013. Radiated emission measurement was performed in semi-anechoic chamber and conducted emission measurement was performed in shield room. For radiated emission measurement, preliminary scans were performed in the semi-anechoic chamber only to determine the worst-case modes. All radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the **"Justification Section"** of this Application. All other measurements were made in accordance with the procedures in part 2 of CFR 47.

1.4 Test Facility

The Semi-anechoic chamber and shielding room used to collect the radiated data and conducted data are **Intertek Testing Services Shenzhen Ltd. Longhua Branch** and located at 101, 201, Building B, No. 308 Wuhe Avenue, Zhangkengjing Community, GuanHu Subdistrict, LongHua District, Shenzhen, P.R. China. This test facility and site measurement data have been fully placed on file with the FCC (Registration Number: CN1188).

Total Quality. Assured.

TEST REPORT

Intertek Report No.: 190603004SZN-001

EXHIBIT 2

SYSTEM TEST CONFIGURATION

2.0 System Test Configuration

2.1 Justification

The system was configured for testing in a typical fashion (as a customer would normally use it), and in the confines as outlined in ANSI C63.10: 2013.

The EUT was powered by a rechargeable battery (DC 3.6V, 6700mAh) which was charged by AC 120V/60Hz during the test. Test modes are as below:

| Configuration | Description |
|---------------|--|
| Mode 1 | UHF transmitting |
| Mode 2 | Simultaneous transmission (UHF and Bluetooth) |
| Mode 3 | Simultaneous transmission (Bluetooth and 2.4GHz transmitter) |

For maximizing emissions below 30 MHz, the EUT was rotated through 360°, the centre of the loop antenna was placed 1 meter above the ground, and the antenna polarization was changed. For maximizing emissions, the EUT was rotated through 360°, the antenna height was varied from 1 meter to 4 meters above the ground plane, and the antenna polarization was changed. This step by step procedure for maximizing emissions led to the data reported in Exhibit 3.0.

The rear of unit shall be flushed with the rear of the table.

The equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). The EUT was placed on a turn table, which enabled the engineer to maximize emissions through its placement in the three orthogonal axes.

2.2 EUT Exercising Software

The EUT exercise program (provided by client) used during testing was designed to exercise the various system components in a manner similar to a typical use.

2.3 Special Accessories

No special accessory attached.

2.4 Measurement Uncertainty

When determining of the test conclusion, the Measurement Uncertainty of test has been considered.

2.5 Equipment Modification

Any modifications installed previous to testing by Astera LED Technology GmbH will be incorporated in each production model sold / leased in the United States.

No modifications were installed by Intertek Testing Services Shenzhen Ltd.
Longhua Branch.

2.6 Support Equipment List and Description

This product was tested in the following configuration:

| Description | Manufacturer | Model No. |
|----------------------|-----------------------------|--|
| USB Charging Adapter | Powertron Electronics Corp. | Model: PS1006-050SIB150 Input: AC 100~240V, 50-60Hz, 0.3A Output: 5Vdc, 1.5A, 7.5W Max |
| USB Charging Cable | (provided by applicant) | Unshielded, 110cm |
| DMX Cable | provided by applicant | Unshielded, 32cm |
| DMX controller | provided by applicant | DMX-100 |
| DMX AC/DC adapter | provided by applicant | Model: 3003 Input: AC 88-256V, 0.5A, 50/60Hz Output: DC 9.0V, 1.0A |

Total Quality. Assured.

EXHIBIT 3

TEST RESULTS

Total Quality. Assured.

TEST REPORT

Intertek Report No.: 190603004SZN-001

3.0 Test Results

Data is included worst-case configuration (the configuration which resulted in the highest emission levels).

3.1 Radiated Test Results

A sample calculation, configuration photographs and data tables of the emissions are included.

3.1.1 Field Strength Calculation

The field strength is calculated by adding the reading on the Spectrum Analyzer to the factors associated with preamplifiers (if any), antennas, cables, pulse desensitization and average factors (when specified limit is in average and measurements are made with peak detectors). A sample calculation is included below.

$$FS = RA + AF + CF - AG + PD + AV$$

Where

FS = Field Strength in dB μ V/m

RA = Receiver Amplitude (including preamplifier) in dB μ V

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB

AG = Amplifier Gain in dB

PD = Pulse Desensitization in dB

AV = Average Factor in -dB

In the radiated emission table which follows, the reading shown on the data table may reflect the preamplifier gain. An example of the calculations, where the reading does not reflect the preamplifier gain, follows:

$$FS = RA + AF + CF - AG + PD + AV$$

Assume a receiver reading of 62.0 dB μ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted. The pulse desensitization factor of the spectrum analyzer was 0 dB, and the resultant average factor was -10 dB. The net field strength for comparison to the appropriate emission limit is 32 dB μ V/m. This value in dB μ V/m was converted to its corresponding level in μ V/m.

RA = 62.0 dB μ V

AF = 7.4 dB

CF = 1.6 dB

AG = 29.0 dB

PD = 0 dB

AV = -10 dB

$$FS = 62 + 7.4 + 1.6 - 29 + 0 + (-10) = 32 \text{ dB}\mu\text{V}/\text{m}$$

Level in μ V/m = Common Antilogarithm $[(32 \text{ dB}\mu\text{V}/\text{m})/20] = 39.8 \mu\text{V}/\text{m}$

3.1.2 Radiated Emission Configuration Photograph

For electronic filing, the worst case radiated emission configuration photograph is saved with filename: radiated photos. pdf.

3.1.3 Radiated Emissions- FCC section 15.209

The data on the following page lists the significant emission frequencies, the limit and the margin of compliance. Simultaneous transmission had been considered during the test.

Worst Case Radiated Emission

at 950.045 MHz

Judgement: Passed by 9.9 dB

Worst Case Operating Mode: Mode 1

Radiated Emissions

| Polarization | Frequency (MHz) | Reading (dB μ V) | Pre-Amp Gain (dB) | Antenna Factor (dB) | Net at 3m (dB μ V/m) | Limit at 3m (dB μ V/m) | Margin (dB) |
|--------------|-----------------|----------------------|-------------------|---------------------|--------------------------|----------------------------|-------------|
| Horizontal | 185.685 | 41.1 | 20.0 | 10.3 | 31.4 | 43.5 | -12.1 |
| Horizontal | 215.755 | 34.5 | 20.0 | 12.0 | 26.5 | 43.5 | -17.0 |
| Horizontal | 950.045 | 39.1 | 20.0 | 17.0 | 36.1 | 46.0 | -9.9 |
| Vertical | 36.790 | 33.9 | 20.0 | 8.6 | 22.5 | 40.0 | -17.5 |
| Vertical | 60.070 | 28.9 | 20.0 | 10.2 | 19.1 | 40.0 | -20.9 |
| Vertical | 850.620 | 25.7 | 20.0 | 27.6 | 33.3 | 46.0 | -12.7 |

NOTES: 1. Quasi-Peak detector is used for frequency below 1GHz.

2. All measurements were made at 3 meters. Harmonic emissions not detected at the 3-meter distances were measured at 0.3-meter and an inverse proportional extrapolation was performed to compare the signal level to the 3-meter limit. No other harmonic emissions than those reported were detected at a test distance of 0.3-meter.
3. Negative value in the margin column shows emission below limit.
4. All emissions are below the QP limit.

3.1.4 Transmitter Spurious Emissions (Radiated) - FCC section 15.209

The data on the following page lists the significant emission frequencies, the limit and the margin of compliance. Numbers with a minus sign are below the limit.

Worst Case Radiated Emission

| Horizontal | *1834.000 | 75.7 | 36.5 | 26.5 | 13.9 | 51.8 | 54.0 | -2.2 |
| Horizontal | *2751.000 | 42.8 | 35.6 | 39.5 | 13.9 | 32.8 | 54.0 | -21.2 |

NOTES: 1. Peak detector data unless otherwise stated.

2. All measurements were made at 3 meters. Radiated emissions not detected at the 3-meter distance were measured at 0.3-meter and an inverse proportional extrapolation was performed to compare the signal level to the 3-meter limit. No other radiated emissions than those reported were detected at a test distance of 0.3-meter.
3. Negative value in the margin column shows emission below limit.
4. Horn antenna used for the emission over 1000MHz.

* Emission within the restricted band meets the requirement of section 15.205. The corresponding limit as per 15.209 is based on Quasi peak limit for frequencies below 1000 MHz and average limit for frequencies over 1000 MHz. The radio frequency emissions above 1GHz also meet corresponding 20dB permitted peak limit with a peak detector function.

** Fundamental emission was measured for determining band-edge compliance of using delta measurement technique.

3.3 Peak Power

Maximum Conducted Output Power at Antenna Terminals, FCC Rules 15.247(b)(2).

The antenna port of the EUT was connected to the input of a spectrum analyzer. The analyzer was set for RBW > 20dB bandwidth and power was read directly in dBm.

For frequency hopping systems operating in the 902–928 MHz band: 1 watt for systems employing at least 50 hopping channels.

| Antenna Gain = 3dBi | | | |
|---------------------|-----------------|-----------------------------------|-------------------|
| Modulation Type | Frequency (MHz) | Output Power (Peak Reading) (dBm) | Output Power (mW) |
| GFSK | 917.00 | 12.90 | 19.50 |
| | 919.60 | 12.93 | 19.63 |
| | 922.20 | 12.95 | 19.72 |

Please refer to the below plots.

Modulation Type: GFSK

CH00 917.00 MHz

CH26 919.60 MHz

CH52 922.20 MHz

3.4 20dB Bandwidth

Maximum 20dB RF Bandwidth, FCC Rule 15.247(a) (1):

The antenna port of the EUT was connected to the input of a spectrum analyzer. Analyzer RBW was chosen so that the display was a result of the hopping channel modulation. For each RF output channel investigated, the spectrum analyzer center frequency was set to the channel carrier. Use the spectrum 20dB down delta function to measure the bandwidth.

| Frequency (MHz) | 20 dB Bandwidth (kHz) | Limit (KHz) |
|-----------------|-----------------------|-------------|
| 917.00 | 83.9 | 500 |
| 919.60 | 83.9 | 500 |
| 922.20 | 85.4 | 500 |

Modulation Type: GFSK

CH0 917.00 MHz

CH26 919.60MHz

CH52 922.20MHz

3.5 Channel Number (Number of Hopping Frequencies)

Minimum Number of Hopping Frequencies, FCC Rule 15.247(a) (1) (iii):

The RF passband of the EUT was divided into 3 approximately equal bands. With the analyzer set to MAX HOLD readings were taken for 2-3 minutes. The channel peaks so recorded were added together, and the total number compared to the minimum number of channels required in the regulation.

Note: For frequency hopping systems operating in the 902–928 MHz band: if the 20dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies.

| | |
|------------------------------|----|
| Number of hopping channels = | 53 |
|------------------------------|----|

Modulation Type: GFSK

CH00-CH26

CH27-CH52

3.6 Channel Separation (Carrier Frequency Separation)

Minimum Hopping Channel Carrier Frequency Separation, FCC Ref: 15.247(a)(1):

Using the DELTA MARKER function of the analyzer, the frequency separation between two adjacent channels was measured and compared against the limit:

Not less than 20dB bandwidth: 85.4kHz

| Channel | Channel Separation (KHz) | Limit (KHz) |
|---------|--------------------------|-------------|
| Low | 100.140 | 85.4 |
| Mid | 100.140 | 85.4 |
| High | 100.140 | 85.4 |

Modulation Type: GFSK

CH0 917.00 MHz

CH26 919.60MHz

CH52 922.20MHz

3.7 Dwell Time (Time of Occupancy)

Average Channel Occupancy Time, FCC Ref: 15.247(a)(1)(i):

The spectrum analyzer center frequency was set to one of the known hopping channels. The SWEEP was set to 20s, the SPAN was set to ZERO SPAN, and the TRIGGER was set to VIDEO. The time duration of the transmissions so captured was measured with the MARKER DELTA function.

Note: For frequency hopping systems operating in the 902–928 MHz band: if the 20dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period.

| Frequency (MHz) | Dwell time Per Hop (s) | Number of hopping channels in 20s | Dwell time (s) | Limit (s) |
|-----------------|------------------------|-----------------------------------|----------------|-----------|
| 917.00 | 0.02029 | 14 | 0.284 | 0.4 |
| 919.60 | 0.02029 | 14 | 0.284 | 0.4 |
| 922.20 | 0.02029 | 14 | 0.284 | 0.4 |

Modulation Type: GFSK

CH0 917.00 MHz

The number of hopping channels in 20s:

CH26 919.60MHz

The number of hopping channels in 20s:

CH52 922.20MHz

The number of hopping channels in 20s:

3.8 Band Edge

Out of Band Conducted Emissions, FCC Rule 15.247(d):

In any 100 KHz bandwidth outside the EUT passband, the RF power produced by the modulation products of the spreading sequence, the information sequence, and the carrier frequency shall be at least 20 dB below that of the maximum in-band 100 kHz emission.

8.1 Discussion of Pulse Desensitization

Pulse desensitivity is not applicable for this device.

8.2 Calculation of Average Factor

Averaging factor in dB = $20 \log (\text{duty cycle})$

The specification for output field strengths in accordance with the FCC rules specify measurements with an average detector. During testing, a spectrum analyzer incorporating a peak detector was used. Therefore, a reduction factor can be applied to the resultant peak signal level and compared to the limit for measurement instrumentation incorporating an average detector.

The time period over which the duty cycle is measured is 100 milliseconds, or the repetition cycle, whichever is a shorter time frame. The worst case (highest percentage on) duty cycle is used for the calculation. The duty cycle is measured by placing the spectrum analyzer in zero scan (receiver mode) and linear mode at maximum bandwidth (3 MHz at 3 dB down) and viewing the resulting time domain signal output from the analyzer on a Tektronix oscilloscope. The oscilloscope is used because of its superior time base and triggering facilities.

A plot of the worst-case duty cycle as detected in this manner are saved with filename: af.pdf

The duty cycle is simply the on-time divided by the period:

The duration of one cycle = 100 ms

Effective period of the cycle = 20.290 ms

DC = 20.290 ms / 100 ms = 0.2029 or 20.29%

Therefore, the averaging factor is found by $20 \log_{10} 0.2029 = -13.9$ dB

8.3 Emissions Test Procedures

The following is a description of the test procedure used by Intertek Testing Services in the measurements of transmitters operating under Part 15, Subpart C rules.

The test set-up and procedures described below are designed to meet the requirements of ANSI C63.10: 2013.

The transmitting equipment under test (EUT) is placed on a styrene turntable which is four feet in diameter and approximately 0.8 meter up to 1GHz and 1.5 meter above 1GHz in height above the ground plane. During the radiated emissions test, the turntable is rotated and any cables leaving the EUT are manipulated to find the configuration resulting in maximum emissions. The EUT is adjusted through all three orthogonal axes to obtain maximum emission levels. The antenna height and polarization are varied during the testing to search for maximum signal levels.

Detector function for radiated emissions is in peak mode. Average readings, when required, are taken by measuring the duty cycle of the equipment under test and subtracting the corresponding amount in dB from the measured peak readings.

The frequency range scanned is from the lowest radio frequency signal generated in the device which is greater than 9 kHz to the tenth harmonic of the highest fundamental frequency or 40 GHz, whichever is lower. For line conducted emissions, the range scanned is 150 kHz to 30 MHz.

Detector function for conducted emissions is in QP & AV mode and IFBW setting is 9 kHz from the frequency band 150 kHz to 30MHz.

8.3 Emissions Test Procedures (cont'd)

The EUT is warmed up for 15 minutes prior to the test.

AC power to the unit is varied from 85% to 115% nominal and variation in the fundamental emission field strength is recorded. If battery powered, a new, fully charged battery is used.

Conducted measurements are made as described in ANSI C63.10: 2013.

The IF bandwidth used for measurement of radiated signal strength was 10 kHz for emission below 30 MHz and 120 kHz for emission from 30 MHz to 1000 MHz. Where pulsed transmissions of short enough pulse duration warrant, a greater bandwidth is selected according to the recommendations of Hewlett Packard Application Note 150-2. Above 1000 MHz, a resolution bandwidth of 1 MHz is used.

Transmitter measurements are normally conducted at a measurement distance of three meters. However, to assure low enough noise floor in the restricted bands and above 1 GHz, signals are acquired at a distance of one meter or less. All measurements are extrapolated to three meters using inverse scaling, but those measurements taken at a closer distance are so marked.
